INSTI	T97A is a polymorphic INSTI-selected mutation that, depending on subtype, occurs in 1% to 5% of viruses from untreated persons. Alone, it has minimal effects on INSTI susceptibility but in combination with other major resistance mutations, it synergistically reduces susceptibility to each of the INSTIs.
	Y143C/R/H are non-polymorphic mutations associated with high-level RAL resistance. Alone, they have minimal effects on EVG susceptibility. However, they are associated with intermediate reductions in EVG susceptibility when they occur in combination with one or more accessory INSTI-resistance mutations. Y143 mutations do not reduce susceptibility to DTG, BIC, or CAB.
