PatientID: HIVDR-1747-23

Sebuttemba 27, 2023

## Color Code

HR: High-Level Resistance

LR: Low-Level Resistance

IR: Intermediate Resistance

S: Susceptible

## Appendix

## Drug abbreviations in full

DRUG.CLASS	ABBREVIATION	DRUG.NAME
	ATV	Atazanavir
	DRV	Darunavir
	FPV	Fosamprenavir
Pī	IDV	Indinavir
F1	LPV	Lopinavir
	NFV	Nelfinavir
	SQV	Saquinavir
	TPV	Tipranavir
	ABC	Abacavir
	AZT	Azidothymidine
	DFT	Stavudine
NRTI	DDI	Didanosine
	FTC	Emtricitabine
	LMV	Lamivudine
	TDF	Tenofovir
	DOR	Doravirine
	EFV	Efavirenz
NNRTI	ETR	Etravirine
	NVP	Nevirapine
	RPV	Rilpivirine
	BIC	Bictegravir
	CAB	Cabotegravir
INSTI	DTG	Dolutegravir
	EVG	Elvitegravir
	RAL	Raltegravir

## Comments

DRUG.CLASS	COMMENTS		
PI			
	D67N is a non-polymorphic TAM associated with low-level resistance to AZT.		
	K219E/Q/N/R are accessory TAMS that usually occur in combination with multiple other		
	TAMs.		
	K70R is a TAM that confers intermediate resistance to AZT and contributes to reduced		
	ABC and TDF susceptibility in combination with other TAMs.		
	L210W is a TAM that usually occurs in combination with M41L and T215Y. The		
	combination of M41, L210W and T215Y causes high-level resistance to AZT and		
	intermediate resistance to ABC and TDF.		
	M184V/I cause high-level in vitro resistance to 3TC and FTC and low/intermediate		
	resistance to ABC (3-fold reduced susceptibility). M184V/I are not contraindications to		
	continued treatment with 3TC or FTC because they increase susceptibility to AZT and		
	TDF and are associated with clinically significant reductions in HIV-1 replication.		
NRTI	M41L is a TAM that usually occurs with T215Y. In combination, M41L plus T215Y confer		
	intermediate / high-level resistance to AZT and d4T and contribute to reduced ddI, ABC		
	and TDF susceptibility.		
	V75T/M/A/S are nonpolymorphic accessory NRTI-selected mutations. They appear to		
	have minimal phenotypic effects on AZT, ABC, and TDF.		

NNRTI	G190A is a non-polymorphic mutation that causes high-level resistance to NVP and intermediate resistance to EFV. It does not significantly reduce susceptibility to RPV, ETR, or DOR.  V108I is a relatively non-polymorphic accessory mutation selected in vitro and/or in vivo with each of the NNRTIs. It appears to contribute to reduced susceptibility to most NNRTIs only in combination with other NNRTI-resistance mutations.
INSTI
