Comments

DRUG.CLASS	COMMENTS		
PI			
NRTI	K70/E/Q/N/T/S/G cause low-leve resistance to ABC and TDF.		
	M184V/I cause high-level in vitro resistance to 3TC and FTC and low/intermediate		
	resistance to ABC (3-fold reduced susceptibility). M184V/I are not contraindications to		
	continued treatment with 3TC or FTC because they increase susceptibility to AZT and		
	TDF and are associated with clinically significant reductions in HIV-1 replication.		
	G190A is a non-polymorphic mutation that causes high-level resistance to NVP and		
	intermediate resistance to EFV. It does not significantly reduce susceptibility to RPV,		
	ETR, or DOR.		
NNRTI	K103N is a non-polymorphic mutation that confers high-level reductions in NVP and EFV		
	susceptibility. It is the most commonly transmitted DRM.		
	V179F is a non-polymorphic mutation selected in combination with Y181C in persons		
	receiving ETR. Alone it has little effect on NNRTI susceptibility, however in combination		
	with Y181C it is associated with high-level reductions in ETR and RPV susceptibility.		
	Y181C is a non-polymorphic mutation selected in persons receiving NVP, ETR and RPV.		
	It confers high-level resistance to NVP, intermediate resistance to ETR and RPV, and		
	low-level resistance to EFV. It does not significantly reduce DOR susceptibility.
