Comments

DRUG.CLASS	COMMENTS		
PI			
NRTI	K65R confers intermediate reductions in susceptibility to TDF, ABC, and 3TC/FTC		
	increases AZT susceptibility. In NRTI-experienced, INSTI-naive patients with K65R,		
	TDF+3TC+DTG is usually highly effective and more effective than AZT/3TC/DTG.		
	However, in patients receiving TDF+3TC+DTG, there is a risk of emergent DTG		
	resistance that does not arise in NRTI-naive patients receiving TDF+3TC+DTG.		
	G190A is a non-polymorphic mutation that causes high-level resistance to NVP and		
	intermediate resistance to EFV. It does not significantly reduce susceptibility to RPV,		
	ETR, or DOR.		
	K101E is a non-polymorphic accessory mutation that confers intermediate resistance to		
	NVP and RPV and low-level reductions in susceptibility to EFV, ETR, and DOR when it		
NNRTI	occurs with other NNRTI-resistance mutations.		
	K103N is a non-polymorphic mutation that confers high-level reductions in NVP and EFV		
	susceptibility. It is the most commonly transmitted DRM.
