Comments

DRUG.CLASS	COMMENTS		
PI			
NRTI	M184V/I cause high-level in vitro resistance to 3TC and FTC and low/intermediate		
	resistance to ABC (3-fold reduced susceptibility). M184V/I are not contraindications to		
	continued treatment with 3TC or FTC because they increase susceptibility to AZT and		
	TDF and are associated with clinically significant reductions in HIV-1 replication.		
	A98G is a non-polymorphic accessory mutation associated with low-level reduced		
	susceptibility to each of the NNRTIs.		
	K103N is a non-polymorphic mutation that confers high-level reductions in NVP and EFV		
NNRTI	susceptibility. It is the most commonly transmitted DRM.		
	Y181C is a non-polymorphic mutation selected in persons receiving NVP, ETR and RPV.		
	It confers high-level resistance to NVP, intermediate resistance to ETR and RPV, and		
	low-level resistance to EFV. It does not significantly reduce DOR susceptibility.
